

Amsterdam Conference Centre

Internet

Amsterdam Conference Centre Beurs van Berlage has a superfast internet infrastructure with a direct fibre-optic connection. The internet recently underwent a major update, ensuring state-of-the-art quality. This guarantees you an excellent internet connection with numerous options.

Hard-wired connection

A hard-wired internet connection is possible in almost every room in the Beurs van Berlage. This gives you added assurance and a constant bandwidth. (There is a choice of 10, 100, or 300 Mbit/s – both up and down and with or without a public IP address). This means that a live stream is possible, connecting a specific device or creating your own network, enabling you to make use of the VLANs configured by the Beurs van Berlage.

Finally, the fibre-optic network (or part of it) can be configured for live TV or radio broadcasts. A direct connection with the Media Gateway and master control room in Hilversum is possible. Other options include live TV broadcasts in another country or part of the world or live streaming to YouTube.

Specifications

- Direct internet fibre-optic connection with a bandwidth of 1,000 Mbit/s (= 1Gb/s)
- High-quality backbone: router, main switches and cabling
- High-performance router with a speed of 1,000 Mb/s
- Switches complete with dual fibre-optic connection (bundling to 2,000 Mb/s)

Cabling: the backbone has been completely replaced by dual redundant fibre optic to secure a stable connection to the internet node. Thanks to the dual fibre optic, the backbone now has a speed of 2,000 Mb/s. The internal fibre optic has also been further future-proofed, does not pick up interference from external devices and has no length restriction.

Reliable network design with segregated disciplines and different internal networks (VLANs). Temporary private networks can be defined without disruption to others. This is possible for each room or the entire location.

Amsterdam Conference Centre

Wi-Fi options

The Wi-Fi facilities are capable of handling large numbers of users simultaneously. The transmitters, equipped with the latest standards, can be customised and adapted to suit your wishes. For your event, a wireless network will be configured in your name or the name of your event.

It is also possible to create separate networks for press and media, front of house, production and sponsors, for example. This provides additional security and ensures fast processing of internet and other data. You can set your own login name and password. We recommend that you use lowercase letters for this to facilitate the use of smartphones..

Telephone services

A range of different telephone services can be deployed using the corporate network with a fixed number.

Special configurations

Beurs van Berlage works in partnership with H&S Computerservices, an ICT company that specialises in solutions for (major) events. All special configurations or system extensions are possible, with or without the use of the fiberoptic connections. Ask your Account Manager or Event Manager for details of the possibilities available.
